

DECORATING THE DM130DTG

TIPS FROM THE EXPERTS

The DM130DTG District® Perfect Tri® DTG Tee is a revolutionary advancement in direct-to-garment (DTG) printing. Thanks to a proprietary technology, this tee is completely pre-treated on the inside and on the outside front, back, sides and sleeves.

The DM130DTG is ready to print right out of the box—making your DTG printing faster, cleaner and more cost-efficient.

Here are a few tips to consider before starting to decorate this tee.

Store the tees in sealed boxes out of the elements. Shirts exposed to normal shop conditions could potentially pick up lint and dust which may affect your print quality.

Before printing, place the tee on a heat press for 15-20 seconds to help reduce any moisture content and to allow the fabric fibers to lay down.

- Time: 15-20 seconds
- Temperature: 300°F
- Pressure: Medium 40-50 lbs.

Avoid using a lint roller on the shirt after pressing. The roller's sticky paper may pull the shirt's fibers back up and they may show through the ink. If a lint roller is needed, do so prior to pressing.

We have successfully tested this shirt on most of the major brands of printers. If your printer uses Dupont inks, please test prior to production and dial in your white base settings for optimal coverage. For best results, do not use with DTG printers that use a wet-on-wet pre-treating process.
